

Please do not attach your emblem until **AFTER** you have finished tightening your knock offs on your car.

Thank you for purchasing your new Tru=wire knock-off wheels from us. Our special emblems are being sent to you separate from the knock-offs that you have selected. We ask that you read and follow these simple instructions before installing your emblems on the knock-offs.

**1)** The knock-offs have a recessed area where the emblems will be installed. We recommend that the emblems **NOT** be attached to the knock-off **until after the knock-off has been tightened down on your adapter once installed on your car.**

**2)** After you have finished hammering the knock-off as tight and securely as you are able with your lead hammer on your car, you may then go forward and attach the emblem. The emblem itself has a 3M glue material on the backside. When you are ready to attach the emblem, simply peel off the 3M seal to expose the glue material.

**3)** Position the emblem exactly as you wish to have it displayed. We recommend showing the eagle positioned as shown with the Tru=wire script in a horizontal position. The tip of the eagle's wing should be at a 90 degree or straight-up position. Be careful that you install the emblem directly into the recessed area of the knock-off where it fits tightly. It is difficult to move the emblem once you have applied it.

**4)** After you have installed your emblem, it should look like the photo on the right. After you drive your car for 25 miles, re-tighten your knock offs being careful not to strike the emblem. The force involved with repeated blows to your knock-off can cause the black finish on the emblem to flake off. Please call us with any questions or comments.

**Thank you.**
